

SKILLS LEARNT TILL LABORATORY 2

The following skills were introduced in the Lab 2 experiments. Remember them, make your own notes so that you may reuse them readily wherever necessary.

- Basic shell commands for file and directory operations, such as mkdir, cd, pwd, cp, mv, rm, chmod, time, command line options of gcc, and others to name a few.
- How to generate a scanner from a given lex script file ?
- Interpret the errors reported by lex or gcc and do the necessary corrections.
- Run the generated scanner on different input files and generate the outputs produced by the scanner using file i/o features of the shell
- Role of %option noyywrap in the lex script
- Role of the section enclosed in %{ and %}
- Place for writing regexes with action in C code between %% and %%
- Consequence of not adding "return number" in the action code
- A single call to yylex() in the main() versus call to yylex() inside a while loop
- Remove white spaces, {space, tab, newline} from the input file during scanning
- Count the number of lexemes recognized by a given pattern
- Use of yytext to display the lexeme recognized.
